EduLearn Beginner-Friendly Networking Learning Application

Presented by: Dafa Radhitya Hanif
Course: CHC401 Final Assessment
Semester: Sept 2025

Background

Background:

The rapid development of online learning platforms has transformed the way students access educational material. However, many beginner IT students still struggle to learn foundational networking concepts because most available platforms are designed for general learning, not for absolute beginners.

In Conclucion:

- Many beginner IT students struggle with fundamental networking concepts.
- Existing e-learning platforms are often too complex or not beginner-oriented.
- Students need simpler, guided, and structured learning tools.

Problem Statement

Despite the availability of many e-learning tools, several issues remain:

- **Learning materials are too technical**

New learners often find networking overwhelming because explanations are not simplified.

- **Poor engagement**

Many platforms do not include small quizzes or interactive assessments that help reinforce concepts.

- **No easy progress monitoring**

Students cannot easily see their improvement or track what they have learned.

- **Inconsistent user experience**

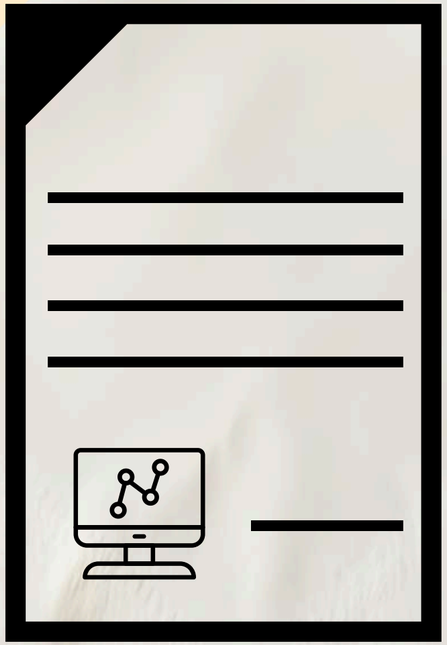
Navigation between pages or materials is not always intuitive for beginners.

EduLearn was created specifically to reduce these barriers and provide a simpler alternative.

Objectives

The primary objectives of this project are:

- To simplify networking concepts using beginner-friendly explanations and structured modules.
- To provide interactive quizzes that allow users to check their understanding immediately.
- To visualize learning progress through score summaries and progress indicators.
- To create an accessible interface so that even users with minimal technical background can use the application without difficulty.



Scope of the System

The current version of EduLearn focuses on delivering the essential functionalities needed for beginner learning:

Included in the scope:

- A login page that personalizes user experience.
- A homepage that serves as the main navigation.
- A materials page with multiple learning topics stored in a structured dictionary.
- A quiz module with dynamic questions and instant feedback.
- A progress page that tracks last score and overall performance.

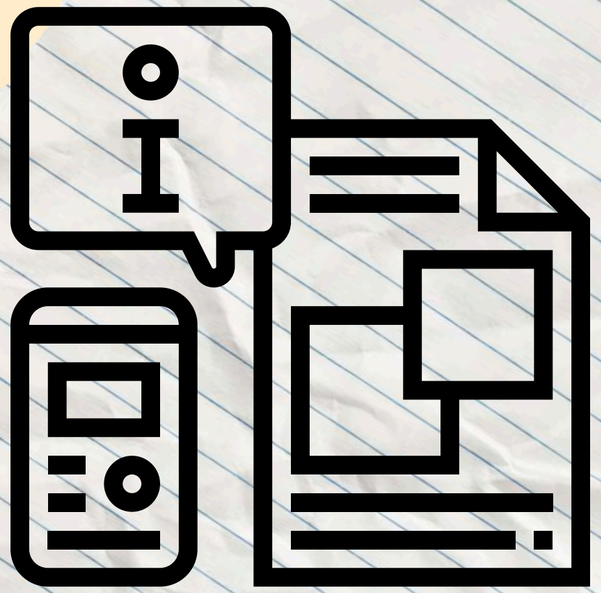
Not included (for future consideration):

- Database storage for persistent user accounts.
- User registration & authentication system.
- Multimedia learning (videos, diagrams).
- Online syncing or multi-user support.
- Advanced features like leaderboards, analytics, or collaborative learning.

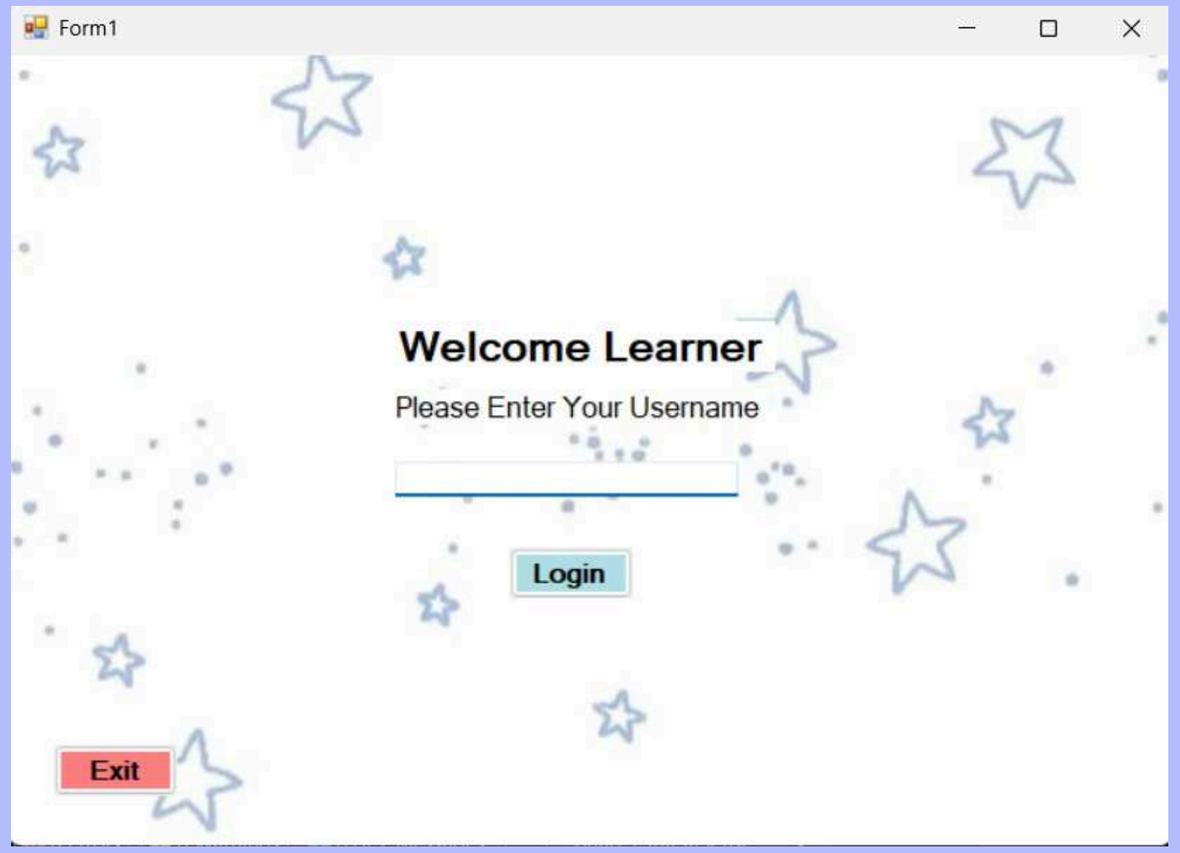
System Architecture

EduLearn is developed using a simple multi-form architecture based on Windows Forms. Each form handles one module, making the system easier to maintain and expand.

- FormLogin: receives username input, starts the session.
- FormHome: acts as the central hub for navigation.
- FormMaterials: loads networking materials through a dictionary structure and displays content in a RichTextBox.
- FormQuiz: loads questions dynamically, presents four answer options, evaluates responses, and updates progress data.
- FormProgress: displays last quiz score, total correct answers, number of questions attempted, and a visual progress bar.

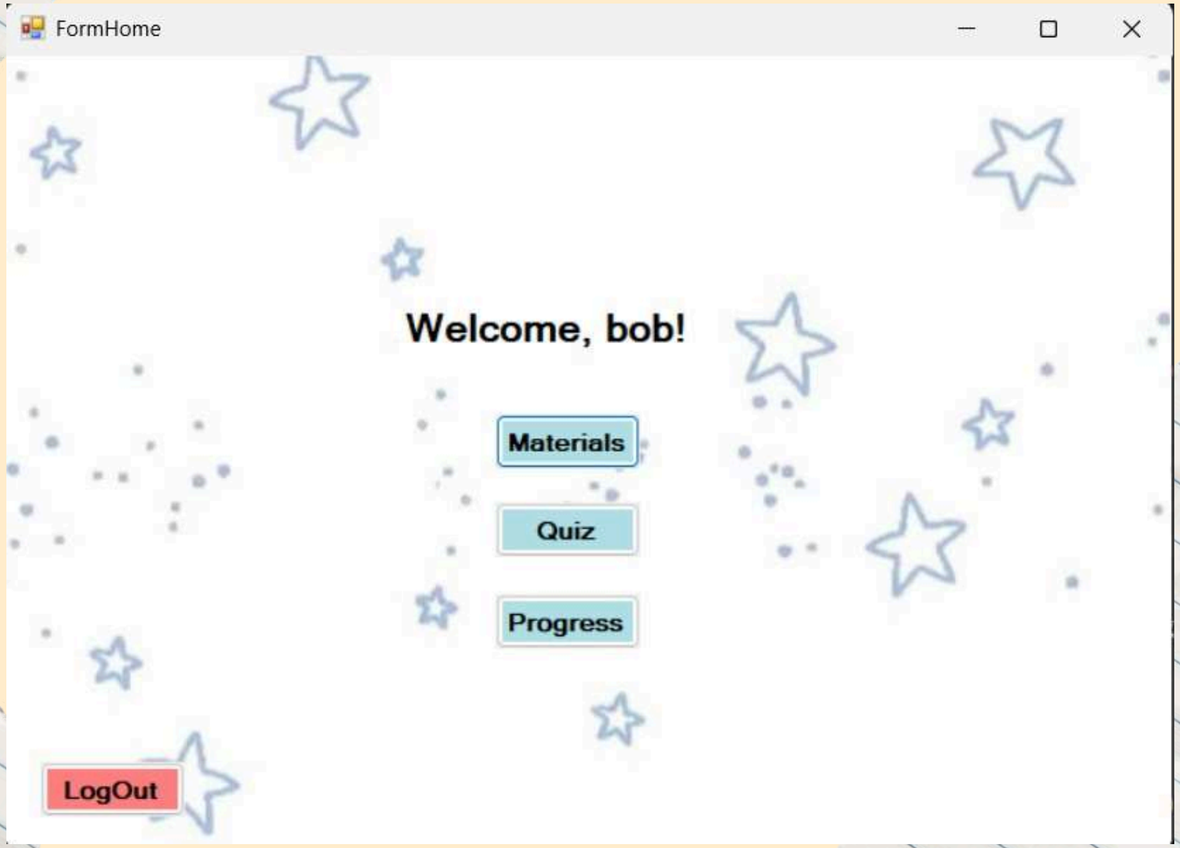


Login Page



1. Login Page
   - Simple and quick: users only enter their name.
   - The system personalizes the experience using greetings.
   - Designed to reduce friction for beginners.

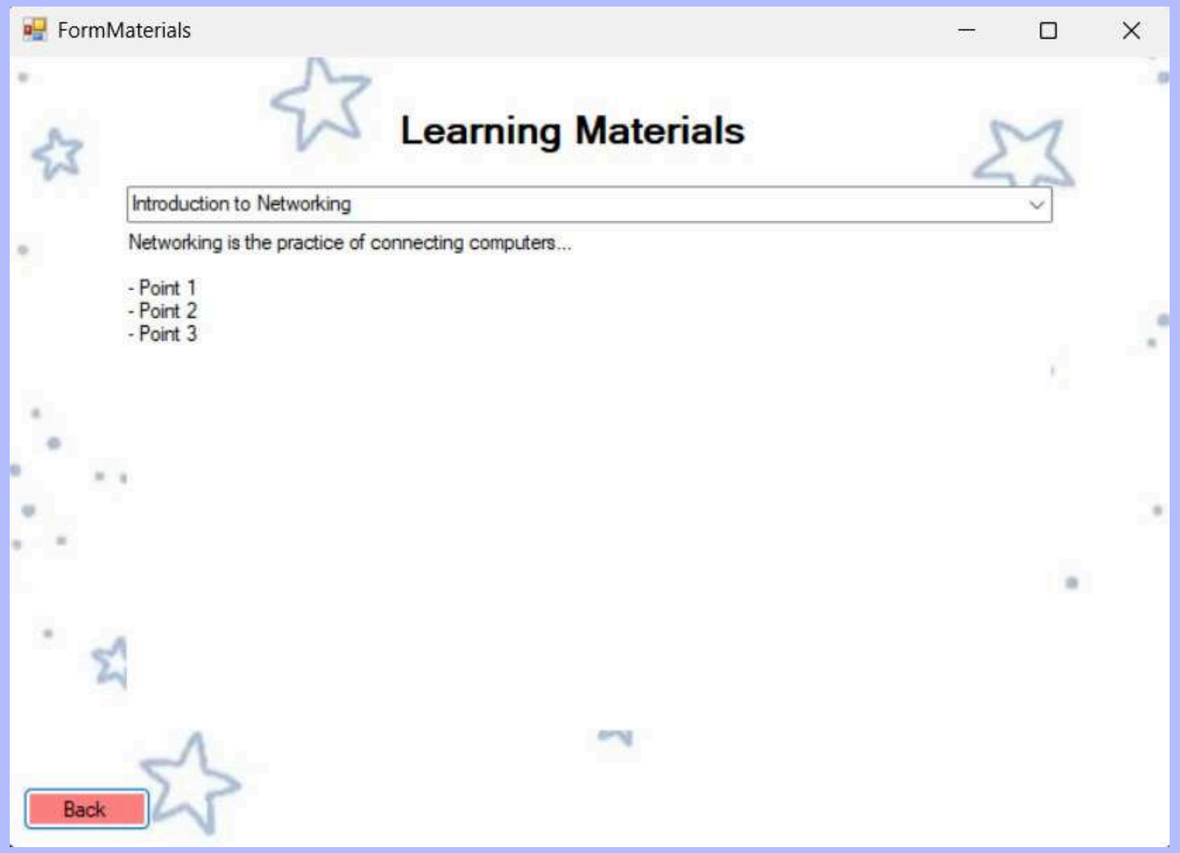
Home Page



2. Home Page

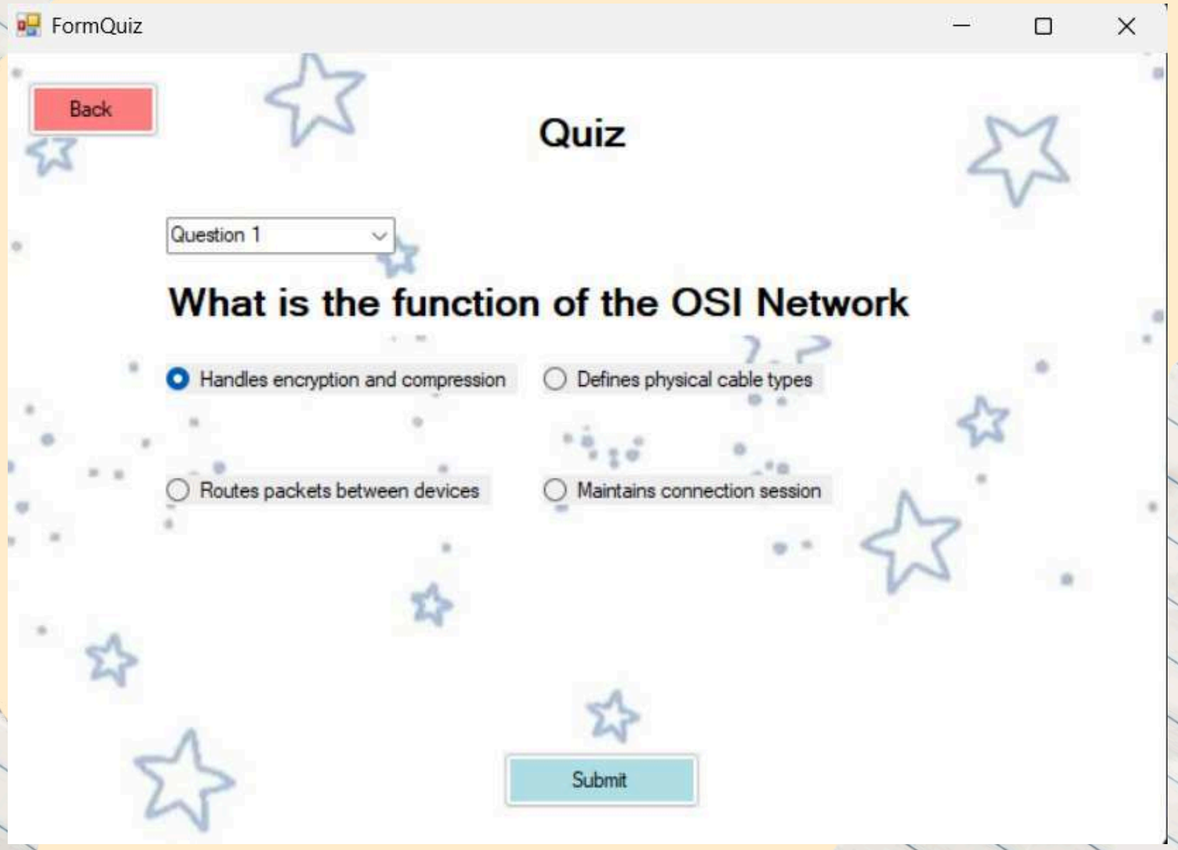
- The Home Page serves as the main navigation hub of EduLearn.
- After logging in, users are welcomed by name, creating a simple and friendly experience.
- All key features are accessible with one click, ensuring easy navigation and a smooth learning flow.

Material Page



3. Material Page
- Contains multiple lessons accessible through a dropdown selector.
- Uses RichTextBox for better formatting and readability.
- Allows users to switch topics dynamically without refreshing the form.

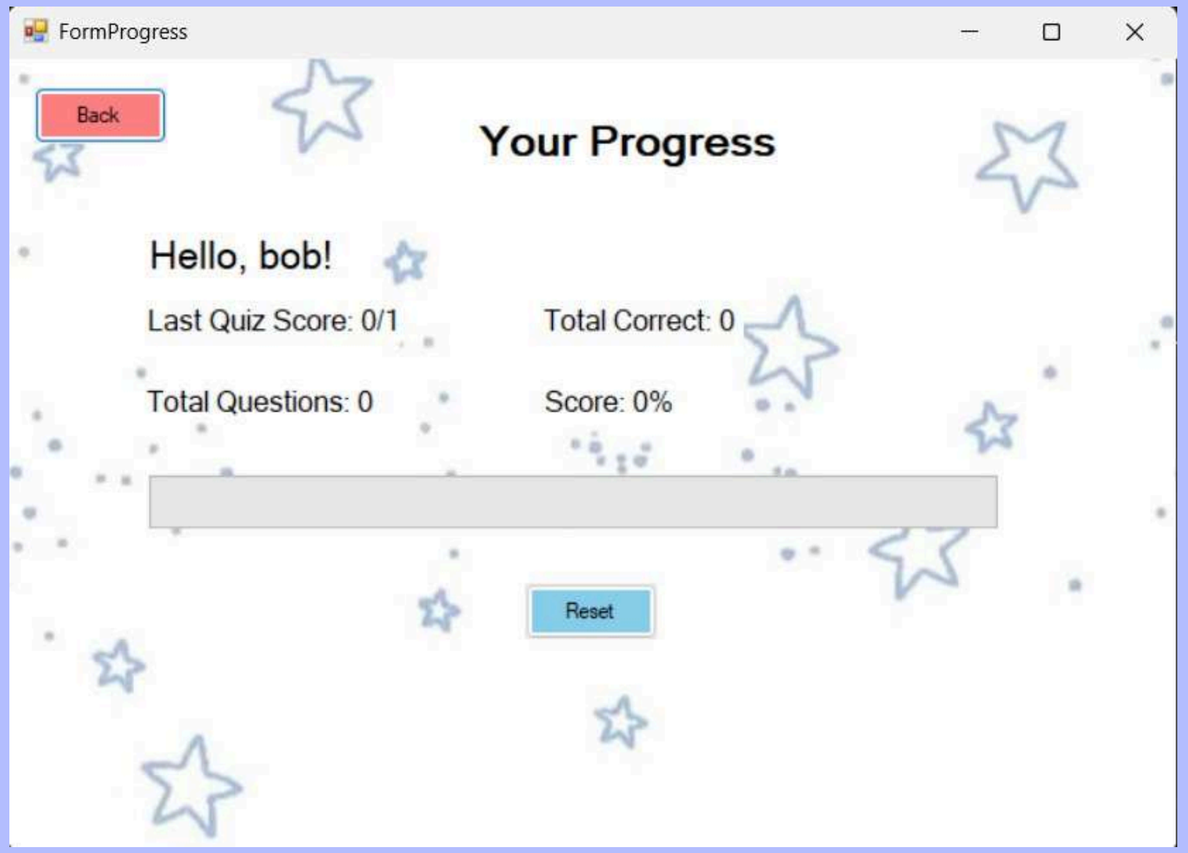
Quiz Page



4. Quiz Page

- Questions are stored in a dictionary in code.
- Each question includes text, four answer options, and a correct index.
- Users get instant feedback after answering.

Progress Page



4. Progress Page

- Shows last quiz score in clear numeric format.
- Total correct answers and total questions attempted are tracked.
- Uses a progress bar to visually show learning progress.
- Includes a reset button to start learning from zero again.

Results from the user survey indicate that most respondents:

Use digital learning platforms weekly or daily

Prefer simple and easy-to-navigate systems

Struggle mostly with technical terminology and layered networking concepts

Rated beginner-friendly materials and quizzes as highly important (4–5/5)

Expect e-learning platforms to provide structured content and direct progress feedback

System Usability Scale (SUS) Evaluation

The System Usability Scale (SUS) helps measure how easy the application is to use.

Dummy SUS results show:

Users found the system easy to understand

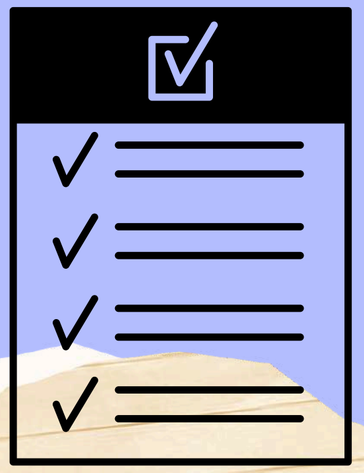
Navigation was consistent across pages

Minimal complexity reported

Users felt confident while using the system

Overall SUS score indicates “Good Usability” for beginners

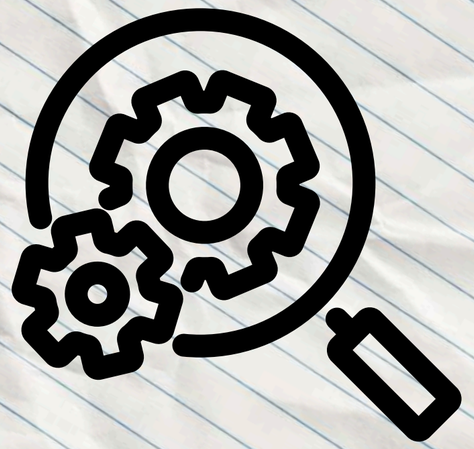
This validates EduLearn’s design as simple and beginner-friendly.



Future Improvements

EduLearn can be improved further with :

- Database support for saving individual user progress
- More detailed materials, especially on subnetting, protocols, and real-world examples
- Randomized quiz pools for more varied assessment
- Better visual design, including icons, layout, and themes
- Exportable progress reports for academic use
- Web or mobile version for easier access and wider reach



THANK YOU
